

Australian Power Plant Chooses ENECLAD To Protect Critical Floor Areas

The existing floor coatings at this Australian power station were badly deteriorated and needed to be replaced. The plant engineers wanted a high performance floor protection system that would give them better results than the previous conventional paint system that had been used.

They contacted Australia's Team ENECON who suggested a standard application of **ENECLAD FPS-2000** in a special blue color. This high performance polymer composite system would provide the plant with the durability - and aesthetics - they were looking for.

The project was completed on time and on budget and the plant engineers are delighted with the results as seen here.
