

Satisfied Clients Recognize the Benefits of Specifying ENECON Materials for Difficult Erosion/Corrosion Applications

A very large office building located in lower Manhattan has been a satisfied ENECON North East client for over 10 years. As a result, when the building engineers purchased new HVAC equipment, they specified that all the new heat exchangers must be

protected with METALCLAD CeramAlloy.

The tube bundles were manufactured by a major HVAC company based in Pennsylvania while the water boxes were manufactured by another international company based in upstate New York.

The tube sheets were, therefore, coated by the ENECON Mid Atlantic Engineering Team in Pennsylvania, while the water boxes were coated in upstate New York under the supervision of ENECON North East.

The building owners were extremely impressed with

ENECON's ability to support this project at both facilities, making sure that the heat exchangers were properly coated and protected regardless of where these were manufactured.
